

AMLs for DMF Data Development

A self-contained system for producing data layers for digital map finishing has been developed at the Missouri Digital Map Finishing Site. The system runs on ArcInfo software in a unix environment and consists of amls, menus, and a manual to create seamless coverages of culture and hydrology. Symbology of the NRCS 37A is displayed rather than lines and points. There is a minimum of command line input and subsequent options and arguments from the user, reducing potential errors and inconsistencies.

If interested in obtaining the AMLs and documentation please contact:
